

1st EnMAP User Workshop 2023 | 11.10.2023

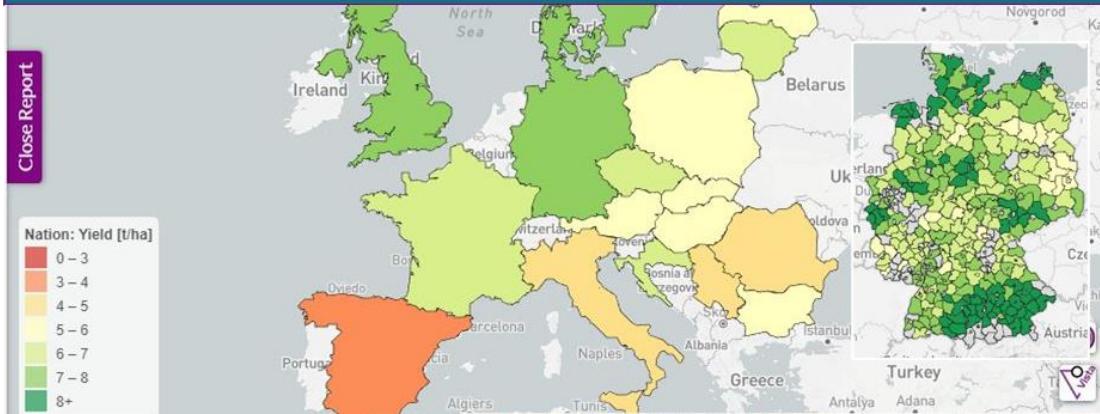

# Using EnMAP data to improve services in the smart farming and renewable energies sector – a first overview

*Sandra Dotzler, C. Jörges, S. Migdall, H. Bach*

VISTA Geowissenschaftliche Fernerkundung GmbH  
München

## Harvest and Yield Prediction

## Optimization of Agricultural Measures

## Crop Monitoring and Risk Management

## Sustainability and Carbon Farming

- **HyperPin** project:

- Duration: 2 years; Kick off in October 2023
- Funded by the Bavarian Ministry of Economic Affairs, Regional Development and Energy under the funding line BayVFP Förderlinie Mobilität - RaumfahrtSustainable management in agriculture
- HyperPin involves the development of a low-cost modular and customizable hyperspectral mission and instrument concept and an innovative data fusion concept for commercial applications based on it.
- In the HyperPin project we will use hyperspectral data for generating training data for machine learning algorithms.
- Applications are not limited to agriculture (e.g. crop rotation classification, detection of winter greening, flower strips and other biodiversity elements), but can be used for a wide range of applications (e.g. monitoring of installed solar power capacity).

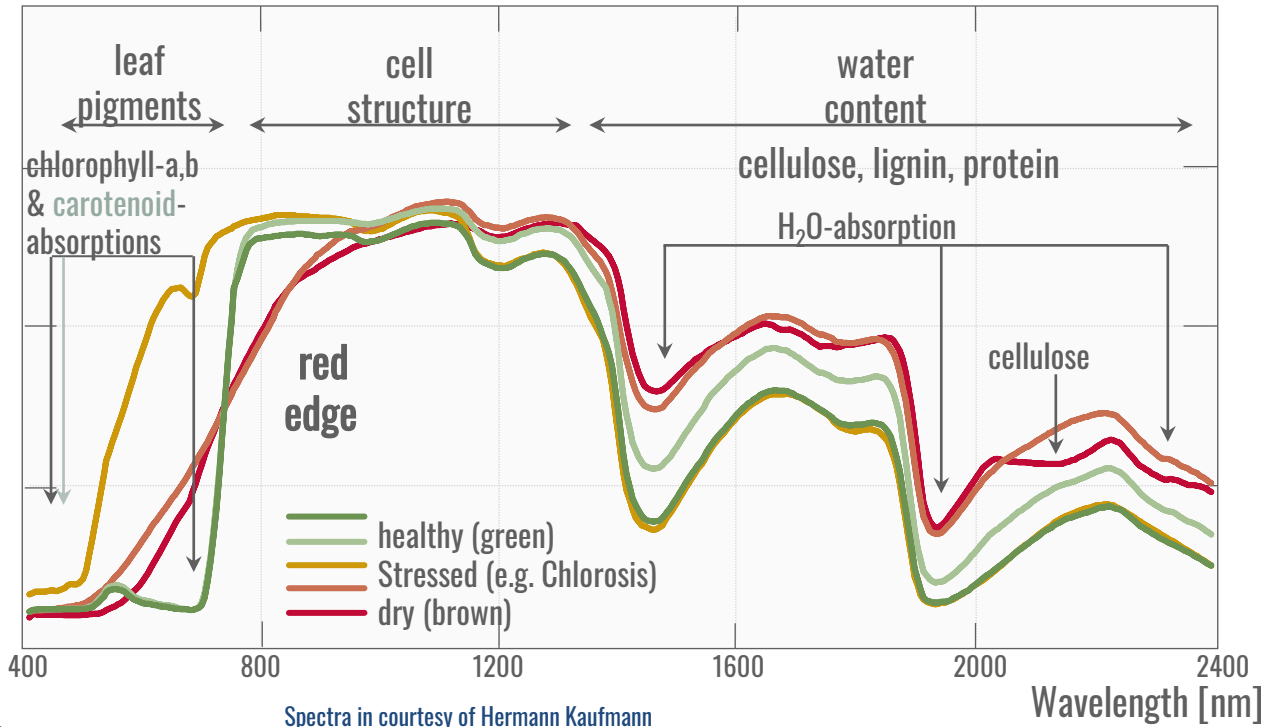

Funded by:

Bavarian Ministry of Economic Affairs,  
Regional Development and Energy

# Generating Training Data for Machine Learning: HyperPin

- Problem: AI models need a lot of training data, but training data are often not sufficiently available
- → hyperspectral data are used to derive physical parameters from EO by using indices, radiative transfer model (RTM) inversion or qualitative spectra
- Pins can be set by using the wide information content of hyperspectral data to find and generate test and training data

# Photovoltaic Detection using HyperPins & Sentinel-2 Machine Learning

- Results of Sentinel-2 PV Detection:

Overall accuracy: 0.97

Fuzzy detection of PV power plants in study area.

Left: Results of ANN output (yellow=1, blue=0). Right: RGB Sentinel-2 Input data.

## ■ Data take planning portal

- It is not possible to make the request for the same location with a different date or a list of dates
- It is not possible to enter the center coordinates of the data take.

**Feedback from the workshop:  
It is now possible to enter center coordinates!**

## ■ Data availability 2023

- Requested: 5 regions (3x Germany, Spain, Austria), every 2 weeks, from April 2023 – November 2023
- → possible data takes: 60
  - **0** data in Germany
  - Austria: 2/5 data takes completely clouded, 1 data take from archive --> 3 useable data takes from April to October, 11th
  - Spain: 1/7 data takes completely clouded → 6 usable data takes from April to October, 11th

- Data processing
  - Data of the area of interest available in archive from someone else's data take → Is it possible to activate an alert in the data archive portal for a certain region? → **not possible**
  - Data with 100% cloud cover are delivered (weather forecast worse than expected...) → is it possible to check again the metadata before delivery? → **within the given acquisition window EnMAP will try to redo the data take, if cloud thresholds have not been met**
  - (Slightly) changing band specifications in the enmap images make it hard for automatic data processing (inversion)...
    - We did not find any document which defines the official wavelengths and spectral response per band and processing version → **as spectral response function a Gauss function can be assumed.**

**(Feedback from the workshop)**

Thank you for your attention!
